Homework # 5
Operator Overloading and Vectors
Due date
Nov 15th 2016

You will rewrite your CPUProgram class so that uses vectors and operator overloading. Your CPUProgram class has the same public member functions as before but now it supports the following operators

- Operator[] that takes an integer and works like the getLine function. It returns the program line as a string.
- Operator+ that takes a CPUProgram and an instruction line as a string. It returns a new CPUProgram that has the original CPUProgram with appended last line from the parameter string.
- Operator+= that takes an instruction line as a string and appends the instruction to the end of the program.
- Operator+ that takes two programs and returns a new program that appends the second programs to the first one
- All comparison operators ==, !=, <, >=, etc. All comparison operators compare the number of lines of the programs.
- Operator>> that prints the program
- Post and pre decrement operators - - that delete the last line of the program.
- Function call operator() that takes two integers and returns a new program that contains the instructions between the given integers.

You should keep your instruction strings in a vector<string> data member. You may use any vector functions as you like.

Important Notes:

- There is no maximum number of lines limit.
- All error checking should be done, for example [] should exit the program if out of index error is encountered.
- Do not forget to indent your code and provide comments.
- You should submit your work to the moodle page. We will provide the test code and other test routines shortly.
